Carbon Tetrachloride Program for 1943 ing the state

POLICY DOCUMENTATION FILE

Class No. 131, 1034

77

M amended.

A. Uses Carbon tetrachloride is used mainly for cleaning and polish-In preparations, fire extinguishers, agricultural poisons, processing un manufacture of food, chemicals, and rubber, and for other industrial and chemical purposes. The most important civilian use, is a cleaning agent.

B. Edsting Restrictions

Use of carbon tetrachloride is restricted under Order M-41,

.Preference ratings of A-10 are assigned to such uses as fungation of stored products; recharging fire extinguishers; processing and manufacture of food, chemicals, rubber etc., where substitutes are impractical; cleaning of metal parts of electric equipment; and degressing al machines especially designed to use such solvents if used in manufacture of aircraft, motor vehicles, arms, and other direct war materials.

Preference ratings of B-2 are assigned to degressing of mathines especially designed if used for other functions than cited above; and for packaged spotting and cleaning preparations; dry cleaning establishments; and manual cleaning of non-absorbent articles other than metal parts of electric equipment. B-2 ratings restrict consumption for such uses to 100% of average monthly consumption during the year ending Heptember 30, 1941.

The effect of Order M-Al in conserving carbon tetrachloride is not known accurately, but it is believed that no significant decrease in usage has been obtained.

C. Findings '

1. Demand for marbon tetrachloride under existing restrictions including military demand is at the rate of 211 million pounds per year. This total indicated demand would require more chlorine for the production of carbon tetrachloride than is expected to be available in 1943 despite some temporary easing of the chlorine supply.

CE STOZOFI VN

TechLaw, Inc.

2. There will, however, be sufficient chlorine to provide a than minimum escential requirements for earbon tetrachloride. """
ment programming of chlorine indicates a probable production of 1900 clinic pounds of carbon tetrachloride in 1943 with 134 million pounds allable for indirect military and civilian uses. The proposed allocates for civilians is 90 million pounds as compared with minimum mential requirements of 53 million pounds. It will provide civilians the 77% of the amount consumed in the fiscal year 1941 and 80% of ment unrestricted demand.

3. Envilor shortages of steel drums have been overcome and entainers, therefore, will not limit the distribution of earbon tetrachbrids as sharply an had been anticipated in the original preparation of the program.

4. Chlorine is difficult to store. The possibility of large mi sudden increases in military demand necessitates its production at a high rate. The diversion of temporary surpluses of chlorine to carbon introductive or other fixed derivatives is a means of meeting civilian meets while maintaining the availability of chlorine productive capacity for military needs.

5. : nobatitutes are for the most part impractical. Carbon intrachloride is unique in that it combines solvent properties with non-flamability.

D. Recommendations

1. Viriam essential requirements should be provided in 1943.

in: 2. Then surpluses permit, allocations among civilian uses bould be made in accordance with the proposals in table II.

3. Flexibility in meeting local and temporary excesses of shlorine by conserting chlorine into carbon tetrachloride should be persitted (once converted into carbon tetrachloride the chlorine cannot be recovered). The total annual production should be as consistent with the proposed allocation as is practical.

i. No government stockpile is recommended as carbon tetrachloride requires: special storage facilities. Private inventory capacity is considered sufficient and ample inventories are provided.

1. The program has been cleared with the interested Divisions.

2. A review memorandum on the Carbon Tetrachloride Program (was prepared Decomber 31, 1942 and submitted to Mr. Burns and Mr. Gay. Several suggestion: in the review memorandum have been incorporated in the revised program. This program, however, represents a considerable revision of the original as a result of the fact that both the chlorine and the steel drum supply have eased in the last few months.

3. The program is in effect a residual one. The justificafor providing more than minimum essential requirements for civilians but it is necessary to keep chlorine plants in operation in order to taken the plant capacity to satisfy increased military demands which isomidered likely to develop toward the end of the year.

- 4. This program also provides estimates of minimum essentirequirements, with the object of defining the most equitable distation of carbon tetrachloride to civilian uses for such periods as minimum essential quantities of the chemical are available. It is nested, however, that if less chlorine is available, other uses such bleaching of pulp and paper should be curtailed before carbon tetracide production is reduced so much as to curtail civilian dry cleaning.
- 5. The proposed allocation will result in filling current first military and civilian demand as follows: drugs and pharmacouticals limited; agricultural, animal and vegetable cils, rubber, synthetic, rical and uses, 100%; cleaning and polishing preparations, 80%.
- 6. The program presents an estimate of total civilian only for 1944, which is some 22 million pounds less than in 1943. It does however, present a proposal as to how this further curtailment shall distributed. I suggest that after some experience under the proposed lecation has been gained, the Chemicals Branch present estimates of them tetrachlorido requirements for 1944.
